**Question 5, p. 9**

Given the function  $f(x) = 1/(x - 2)$ , the linear approximation of  $f(x)$  around  $x = -1$  is most nearly:

**Question 50, p. 27**

A system is designed to allow at least **10,000** Btu/min of heat to be transferred ( $Q$ ) **from the system to the air** as air flows through it. The system can be operated so that air ( $c_p = 0.26$  Btu/lb-F) flowing at 500 lb/min will exit at 100°F. The minimum temperature (°F) the air can enter the system is \_\_\_\_\_.

**Question 68, p. 36**

Match the treatment technology that will best achieve the treatment objective for the potable reuse of water. Use each technology only once.

<b>Treatment Objective</b>	<b>Treatment Technology</b>
A. Remove suspended solids	1. UV/H <sub>2</sub> O <sub>2</sub>
B. Reduce dissolved nutrients	2. Media filtration
C. Degrade trace organics	3. <b>Biologically active filtration</b>

**Solutions Table, p. 52**

50: The correct answer is: 23 to 24°F

**Solution 24, p. 63**

Refer to the *FE Reference Handbook*, Environmental Engineering chapter, Steady-State Reactor Parameters.

$$C_t = C_0[\exp(-k \theta)]$$

Given:  $k = 0.1 \text{ min}^{-1}$   
 $\theta = 1 \text{ hour} = 60 \text{ min}$

Let  $C_0 = 100\%$

$$C_t = 100\% [\exp(-0.1 \text{ min}^{-1} \times 60 \text{ min})] = 100\% [\exp(-6)] = 100\% (0.00248) = 0.248\%$$

Removal efficiency,  $\eta = 100\% - 0.248\% = 99.752\%$ , which is most nearly 99.9%.

**THE CORRECT ANSWER IS: C**

**Solution 25, p. 64**

Refer to the Cylindrical Pressure Vessel section in the Mechanics of Materials chapter of the *FE Reference Handbook*.

The cylinder can be considered thin-walled if  $\frac{t}{\frac{d_i}{2}} \leq 0.10$ . In this case,  $t = 12 \text{ mm}$  and  $d_i = 700 \text{ mm}$ .

Since  $\frac{t}{\frac{d_i}{2}} = \frac{12}{350} = 0.034$  which is  $\leq 0.10$ , the pipe is thin-walled.

$$\text{Thus } \sigma_t = \frac{P_i r}{t}$$

$$\text{where } r = \frac{r_i + r_o}{2} = \frac{350 + 362}{2} = 356 \text{ mm}$$

$$\sigma_t = \frac{(1.680 \text{ MPa})(356 \text{ mm})}{12 \text{ mm}} = 49.8 \text{ MPa}$$

**THE CORRECT ANSWER IS: B**

**Solution 50, p. 75**

Refer to the Compressors section in the Fluid Mechanics chapter of the *FE Reference Handbook*.

$$Q = m c_p (T_2 - T_1)$$

Solve for  $T_1$

$$-T_1 = [Q/m c_p] - T_2$$

$$T_1 = T_2 - [Q/m c_p]$$

Substitute and solve

$$T_1 = 100^\circ\text{F} - [10,000 \text{ Btu/min}/(500 \text{ lb/min})(0.26 \text{ Btu/lb-}^\circ\text{F})]$$

$$T_1 = 100^\circ\text{F} - (76.9^\circ\text{F})$$

$$T_1 = 23.1^\circ\text{F}$$

~~Since the negative is showing a loss of heat, the initial temperature = 669°F.~~

**THE CORRECT ANSWER IS: 23°F to 24°F**

**Solution 68, p. 82**

Examinees are expected to be familiar with various treatment technologies.

**Treatment Objective**

- A. Remove suspended solids
- B. Reduce dissolved **nutrients**
- C. Degrade trace organics

**Treatment Technology**

- 2. Media filtration
- 3. Biologically active filtration
- 1. UV/H<sub>2</sub>O<sub>2</sub>

**Solution 56, p. 78**

Refer to the Streeter Phelps equation in the Stream Modeling section in the Environmental Engineering chapter of the *FE Reference Handbook*.

$$t_c = \frac{1}{k_r - k_d} \ln \left[ \frac{k_r}{k_d} \left( 1 - D_a \frac{(k_r - k_d)}{k_d L_a} \right) \right]$$

$$D = \frac{k_d L_a}{k_r - k_d} \left[ \exp(-k_d t) - \exp(-k_r t) \right] + D_a \exp(-k_r t)$$

$$DO = DO_{\text{sat}} - D$$

From the question statement:

$$k_r = 0.4 \text{ day}^{-1}$$

$$k_d = 0.2 \text{ day}^{-1}$$

$$D_a = DO_{\text{sat}} - DO_{\text{initial}} = 9.2 - 7.0 = 2.2 \text{ mg/L}$$

$$L_a = 15 \text{ mg/L}$$

$$t_c = 2.67 \text{ days}$$

$$Dt_c = 4.39 \text{ mg/L}$$

$$DO = DO_{\text{sat}} - Dt_c = 9.2 - 4.39 = 4.8 \text{ mg/L}$$

**THE CORRECT ANSWER IS: C**
