Errata posted 09/20/2021

Revisions are shown in red.

Solution 12, p. 70

~~Refer to the Intellectual Property section in the Ethics chapter of the *FE Reference Handbook*.~~

Shapes, colors, and visual features are protected by industrial design rights.

THE CORRECT ANSWER IS: D

Solution 46, p. 91

Refer to the Torsion section in the Mechanics of Materials chapter of the *FE Reference Handbook*.

The polar moment of inertia for a solid cylinder is

$$J = \frac{\pi r^4}{2} = \frac{\pi \left(\frac{d}{2}\right)^4}{2} = \frac{\pi d^4}{2(2)^4} = \frac{\pi d^4}{2(16)} = \frac{\pi d^4}{32}$$

The equation for the shear stress

$$\tau = \frac{Tr}{J} = \frac{T\left(\frac{d}{2}\right)}{J}$$

Substituting for polar inertia into the equation for the shear stress gives

$$\tau = \frac{Tr}{J} = \frac{T\left(\frac{d}{2}\right)}{\frac{\pi d^4}{32}} = \frac{16T}{\pi d^3}$$

Solving for torque gives

$$T = \frac{\pi d^3 \tau}{16} = \frac{\pi (0.2)^3 (840 \times 10^3)}{16}$$

$$T = 1,319 \text{ N}\cdot\text{m}$$

THE CORRECT ANSWER IS: C

Solution 95, p. 114

Refer to the Hooke's Law section in the Mechanics of Materials chapter of the *FE Reference Handbook*.

The formula for the total longitudinal strain without a temperature rise is:

$$\epsilon_{\text{axial}} = \frac{1}{E} (\sigma_l - \nu(\sigma_t + \sigma_r)) = \frac{1}{210 \times 10^3 \text{ MPa}} (23.1 \text{ MPa} - 0.24(46.2 \text{ MPa} + 0)) = 5.72 \times 10^{-5}$$

This must be converted to displacement using the following formula:

$$\epsilon_{\text{axial}} = \frac{\delta l}{l}, \text{ where } l \text{ is the length of the section under consideration}$$

$$\delta l = \epsilon_{\text{axial}} \times l$$

$$= 5.72 \times 10^{-5} \times 1,000 \text{ mm}$$

$$= 0.0572 \text{ mm}$$

THE CORRECT ANSWER IS: A

Solution 99, p. 117

The first line of the solution should read as follows:

Use the Failure by Pure Shear equation from the Joining Methods section in the Mechanical Engineering chapter of the *FE Reference Handbook*.
